

DeBug : A Decentralised Bug-Bounty Platform

Inhouse Project

Major Project II

Review 1

Domain: Blockchain

Sustainable Development Goal:

- Decent Work and Economic Growth
- Industry, Innovation, and Infrastructure

Group Number : 19

Group Members :

Rohit Shahi [D17C/58]

Gopal Vanjarani [D17C/66]

Gaurav Mahadeshwar [D17C/43]

Umesh Tolani [D17C/64]

Project Mentor :

Ms. Geocey Shejy

Introduction to Project

DeBug is an innovative decentralized bug-bounty platform that aims to build a transparent, trustworthy, and scalable ecosystem for security vulnerability reporting and reward distribution. By leveraging blockchain technology, it eliminates custodial risks, opaque payouts, and privacy concerns found in traditional platforms. DeBug follows a hybrid model—its on-chain Layer-2 components manage escrow, payouts, and dispute resolution, while off-chain web services handle authentication, encrypted submissions, notifications, and researcher reputation. This integration ensures verifiable payouts, researcher anonymity, and reputation portability across platforms. Designed for security researchers, software organizations, startups, and open-source communities, DeBug creates a fair, secure, and efficient environment for ethical vulnerability disclosure and collaboration.

Problem Definition

Traditional bug bounty platforms rely heavily on centralized trust and manual policies, which often lead to inefficiencies and researcher dissatisfaction. Verification of submitted reports is typically slow and lacks transparency, resulting in delays and friction in reward distribution. Moreover, arbitrary reward caps frequently undervalue critical exploits, discouraging skilled researchers from active participation. Disputes, inconsistencies in payout decisions, and custodial risks further erode researcher confidence. These limitations not only weaken trust between organizations and security researchers but also increase the risk of undisclosed vulnerabilities remaining unpatched, leaving systems exposed to potential threats.

Block Diagram

Modular Diagram

Implementation Details

❖ **Bounty Creation**

- Owner drafts bounty with tiers & deadlines, Funds escrow smart contract on **Solidity chain**.

❖ **Submission**

- Researcher prepares and encrypts report (client-side).
- Report stored on **IPFS**; metadata and pointers stored in **PostgreSQL** via backend.

❖ **Validation & Triage**

- Backend (Express + Prisma) validates submission format, Owner reviews securely through auditing service.

❖ **Decision & Payout**

- On acceptance, **Solana contract releases payout** to researcher's wallet.
- Optional dispute handled via off-chain arbitration + contract hooks.

❖ **Settlement & Reputation**

- Smart contract emits payout event.
- Backend services update researcher reputation, logs, and notifications.

ChainHunt

[Home](#) [Features](#) [FAQ](#) [CONNECT WALLET](#)

Why ChainHunt?

The most advanced Web3 bug bounty platform

Smart Contract Escrow

Funds secured on-chain until vulnerability is verified

AI-Powered Analysis

Automated severity scoring and report enhancement

Instant Payouts

Get rewarded immediately upon approval

Secure & Transparent

All transactions recorded on blockchain

Reputation System

Build your profile and climb the leaderboard

Global Community

Join thousands of security researchers

Implementation Screenshots

ChainHunt

How It Works

Simple process, powerful results

For Hackers

- 1 Connect wallet & create profile
- 2 Browse active bounties
- 3 Find vulnerabilities & submit reports
- 4 Get rewarded instantly

For Organizations

- 1 Register & verify domain
- 2 Create bounties with escrow
- 3 Review AI-powered submissions
- 4 Approve & secure your project

2

ChainHunt

Choose Your Role

Join ChainHunt as a security researcher or protect your smart contracts

Security Researcher

Hunt for vulnerabilities, earn rewards, and build your reputation

- ✓ Browse active bounties
- ✓ Submit vulnerability reports
- ✓ Earn crypto rewards instantly
- ✓ Climb the leaderboard

Organization

Secure your smart contracts with the power of the community

- ✓ Post bug bounties with escrow
- ✓ Review AI-enhanced reports
- ✓ Manage submissions easily
- ✓ Track security analytics

N

Next Work Plan

- ❖ **Notifications Service** → real-time updates using **WebSocket** (authenticated with JWT).
- ❖ **Caching & Optimization** → Redis for sessions, caching bounty listings, profile lookups.
- ❖ **Monitoring & Logging** → Prometheus + Grafana for metrics, alerts, dashboards.
- ❖ **Storage Integration** → IPFS for decentralized storage of reports & evidence.
- ❖ **Infra** → Dockerize all services, orchestrate with AWS ECS/Kubernetes.
- ❖ **Research paper drafting** → Formal documentation of system design and implementation details following publication standards.
